

Fortress + Compass: SaaS and GTM Brief

Paste this file into any AI tool as context, then continue from the "Open questions" section at the bottom.

Context

- Company: Risknox.ai, a cybersecurity and GRC SaaS company selling to financial institutions in India and the GCC.
- Fortress: GRC and cyber risk quantification platform. It has an IRIS score, estimated loss figures, asset management, regulation audits (for example SEBI CSCRf), attack path analysis, mitigation planning and a cyber insurance marketplace view. Earlier UI scoping cut 62 screens to 38, with an MVP of 14.
- Compass: assumed to be the insurance marketplace layer, the "Insured" step in the Compliant, Secure, Insured pipeline. Confirm this before relying on the bundle logic below.
- Current status: one insurer is onboarded. The plan is to sell Compass and Fortress to insurers as a bundle, so insurers get visibility into their policyholders.
- Two goals: (1) turn Fortress into a SaaS with real users onboarded, (2) sell Compass plus Fortress as a bundle to insurers.

1. Fortress SaaS roadmap (12 months)

Phase 0, weeks 1-4: decisions

- Pick one ICP: mid-size Indian banks, NBFCs and brokers under SEBI CSCRF or RBI rules. GCC later.
- Choose tenancy: multi-tenant by default, plus a single-tenant or private-cloud option because many banks will ask for it.
- Host in-region for data residency (India first, then KSA and UAE).
- Set packaging: tiers by asset count and frameworks, annual contracts.

Phase 1, months 1-3: real MVP

- Build the 14 MVP screens, not all 38.
- Multi-tenant core: onboarding, RBAC, SSO, audit logs, encryption.
- Risk quantification engine with a transparent method a CISO can defend.
- One framework done properly (SEBI CSCRF), with exportable board and audit reports.
- Billing and subscription management.

Phase 2, months 3-6: make it sticky

- Integrations: vulnerability scanners, MISP, cloud and IAM sources.
- Mitigation planning and attack path analysis on live data.

- Add RBI, NCA ECC, SAMA and CBUAE frameworks with reusable control mapping.
- In-app usage analytics.

Phase 3, months 6-9: scale the motion

- Connect Fortress to the partner portal so resellers can provision tenants.
- White-label option for channel partners.
- Attack surface management.
- Certify Fortress itself (ISO 27001, SOC 2).
- Insurance marketplace features, after checking licensing.

Phase 4, months 9-12+: expand

- AI assistant for gap explanations and remediation drafts (internal wording rule: say "AI governance" or "AI oversight" in marketing, not "AI-powered").
- Peer benchmarking, public API, more regional frameworks.

Biggest risk: building all 38 screens before one bank has paid for the 14.

2. Insurer companion-app model

- The insurer sponsors or discounts Fortress for its policyholders.
- Clients onboard through an insurer-branded invite and own their own tenant.

- Clients opt in to share a scoped view (scores, control status, trends) with the insurer. Raw asset and vulnerability data stays private.
- The insurer gets a portfolio console. The client gets the full product.

What the insurer gets: pre-bind risk view for underwriting, portfolio and accumulation risk, alerts when a client's posture drops before renewal, fewer claims.

What the client gets: better terms or premium discounts, and a discounted or free GRC tool.

Build needs: parent-child tenancy (insurer over policyholders), consent-based sharing, insurer console (portfolio dashboard, per-client score trend, renewal risk list), scoring API, branded onboarding. Put parent-child tenancy in the core design early, because retrofitting it is painful.

Pricing idea: per policyholder per year, paid by the insurer, with volume tiers.

3. Starting with the onboarded insurer

Treat the first insurer as a design partner.

Weeks 1-2: lock terms

- Get pilot size, duration, payer and success criteria in writing.
- Agree data rules: what the insurer sees, what stays private, how consent works.
- Name an owner on their side (underwriting or risk, plus IT or procurement). Weekly call.

- Get a policyholder list. Aim for 20 to 50 pilot clients.

Weeks 2-4: build the minimum

- Parent-child tenancy, branded invite, consent screen, basic insurer console (client list, score, trend, last activity).
- Skip the scoring API, alerts and benchmarking for now.

Month 2: onboard 5 friendly clients first, fix friction, then widen. Have the insurer's relationship managers send the invites. Track time to first risk report.

Month 3: prove value. Review onboarding rate, score changes, gaps closed and underwriting time saved. Ask underwriters whether the data changed any pricing or renewal decision. Write one case study with permission.

In parallel: get their actuarial or underwriting team to review the scoring logic, have counsel review consent and data terms, keep insurer-specific rules in configuration and not code.

4. Scaling the bundle

The bundle in one line: Fortress shows how risky a client is, Compass gives the insurer a channel to write that client's policy. A better score leads to better terms, which gives clients a reason to keep using Fortress.

Scaling Fortress onboarding

- Standard setup path: CSV or connector asset import, pre-built framework templates, default risk model.

Custom setup is a paid add-on.

- Target time to first risk report under a week.
- Acquire clients through insurer invites so acquisition cost stays near zero.
- Write an onboarding playbook and in-app checklist now.
- Track how many clients one customer success person can carry.

Selling the bundle to insurers

- Pitch three buyers separately: underwriting (data), portfolio and claims (accumulation risk), distribution or product (new premium through Compass).
- Package in three layers: sponsored Fortress for policyholders, insurer console, Compass placement.
- Price in parts: platform fee, per-policyholder fee, commission on Compass placements. Keep the scoring fee separate from commission.
- Expand by adding more insurers to Compass. Do not give the first insurer exclusivity, or the marketplace loop breaks.

Risks

- Conflict of interest: the same platform scores clients and sells them insurance. Keep the methodology documented and independent of Compass earnings.
- Licensing: check with counsel whether Compass placement needs a broker licence under IRDAI rules. Also review DPDP Act, and PDPL for Saudi.

5. Selling Fortress as SaaS directly

- Sales-assisted SaaS with a pilot as the entry point. Not self-serve.
- Start with one segment and one regulation (SEBI-regulated brokers and NBFCs facing CSCRf). Buyer is the CISO or compliance head, trigger is an audit deadline.
- Offer: "See your cyber risk in rupees and your CSCRf gaps in 30 days." Outputs are a risk report using their own assets and a regulation-mapped gap list with a mitigation plan.
- Pricing: three tiers by asset count, one framework included, add-ons for extra frameworks and business units, annual contract in INR, onboarding fee, paid pilot credited against year one.
- Free trial: do not use open signup. Use a public sample-data sandbox for exploration, then a gated 30-day trial after a qualification call (audit date, asset count, decision maker) with a defined success goal. A small paid pilot fee filters out tyre-kickers if delivery is stretched.
- Insurer route is different: the insurer pays, so policyholders get a simple invite link and no trial clock.
- Aim for three paying customers and one case study before scaling spend.

6. Getting customers

1. Insurer-led: policyholder list and warm intros. Aim for 20 to 50 clients. Ask the insurer to raise Fortress at

renewal.

2. Direct outbound: list of 100 to 200 SEBI-regulated brokers, NBFCs and small banks, prioritising audit dates in the next 6 months. Reach CISOs and compliance heads by LinkedIn and email with a specific offer. Follow up 3 to 4 times. Target 5 to 10 discovery calls per 100 contacts.
3. Content: regulation-specific landing pages with the ROI calculator as the call to action, the BFSI LinkedIn series, CISO-focused blogs, a webinar on what CSCRf auditors will ask for.
4. Partners, after the first 3 wins: resellers and audit firms with a referral fee and a demo tenant.

Weekly rhythm: 25 new outbound contacts, 3 to 5 calls booked, 2 demos, 1 pilot started per month. Log everything in a CRM.

7. GTM plan

Positioning: Compliant, Secure, Insured. Fortress shows cyber risk in rupees and regulation gaps. Compass turns a better score into better insurance terms.

Two motions run together: insurer channel (volume) and direct sales (proof and revenue).

Days 1-30: fix ICP, pricing and pilot offer. Build sample tenant, ROI calculator and one CSCRf landing page. Finish parent-child tenancy and basic insurer console. Get the insurer's first policyholder list.

Days 31-90: onboard 20 to 50 policyholders via the insurer.
Send 100+ outbound messages and start 2 to 3 direct pilots.
Publish one regulation-led post or webinar a week. Collect
onboarding rate, time to first report, gaps closed.

Months 4-6: convert pilots to annual contracts. Write one
insurer and one direct case study. Wire Fortress scores into
Compass quotes. Pitch a second insurer with the case study.

Months 7-12: open reseller and audit-firm partners via the
partner portal. Add RBI, NCA and CBUAE frameworks for
GCC. Hire customer success once one person cannot handle
onboarding.

Metrics: time to first risk report, pilot-to-paid rate,
policyholders onboarded per insurer, net revenue retention,
cost to acquire by channel.

Main risks: insurer asking for exclusivity, slow procurement
at banks, building features before three customers are
paying.

Open questions

- What does the insurer expect from Compass in this first deal: quote flow, or only listing their products?
- What exactly did the insurer sign: paid pilot, LOI or full contract?
- Confirm what Compass is and whether it needs a broker licence.
